P-PSDB;
PCR amplification was used to obtain rpoB genes from rifamplcin-
resistant Mycobacterium leprae strains. A comparison with the
sequence of the rpoB gene from sensitive strains (AAQS1532) revea
mutations in the region encoding amino acids 400-450. A common
                                                      Rapid detection of antibiotic resistance in Mycobacteria isoniazid, rifampicin or streptomycin resistance in tube by detecting mutation in katG, rpoB or rpsL genes

The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigeila and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and similar immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 bp region of the Mycobacterium tuberculosis rpoB gene, which, when mutated is associated with rifempin resistance. The 620 bp region amplified spans both the H451Y and S456L mutations. The amplified fragments are given in AAT29124 (Wild type) and AAT29125-26

The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 bp region of the Mycobacterium tuberculosis rpoB gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the H451Y and S456L mutations. The amplified fragments are given in AAT29124 (Wild type) and AAT29125-26

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR amplification was used to obtain rpoB genes from rifampicin-resistant Mycobacterium leprae strains. A comparison with the sequence of the rpoB gene from sensitive strains (AAQ51532) revealed mutations in the region encoding amino acids 400-450. The corresp. region was isolated from M.tuberculosis (AAQ61457). A common mutation seen in resistant strains occurs at codon 425 where Ser is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpob, katG, rpsL/sl2 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic
                                                                            Example
                                                                                                                                       WPI;

(clarofloxacin) ambA (ethambutol), pncA (pyrazinamide), gyrA
(ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis.
Chese primers can be used in a method for the detection and
characterization of M. tuberculosis present in a sputum sample.
Characterization of M. tuberculosis present in a sputum sample.
Characterization of M. tuberculosis present in a sputum sample.
Characterization of M. tuberculosis present in a sputum sample.
Characterization of M. tuberculosis present in a sputum sample.
Characterization of M. tuberculosis and if present to evaluate the presence of M.
Characterization, to detect the presence of M.
Characterization, to detect the presence of M.
Characterizations and if present to evaluate the rpoB, katG, rpsL/s12
and 23S genes for the presence of antibiotic-inducing mutations.
Clarify the control of the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene amplification primer rpoB-R (bp 2611-2592). It is used with the forward primer given in AAA49823 and with the sequencing primers given in AAA49825 and AAA49826 for the detection and analysis of antibiotic resistance-associated mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  analysis of antibiotic resistance-associated mutations in regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and
The present sequence is that of the Mycobacterium tuberculosis
                                                            Claim 4; Page 5; 43pp; English.
                                                                                                                               Method for the detection and characterization of Mycobacterium tuberculosis with antibiotic resistance in a sample - \,
                                                                                                                                                                                                                                         WPI; 2000-431611/37.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR (isoniazid), rpsL/s12 (streptomycin), 165/rrs (streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12 and 23S genes for the presence of antibiotic inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed to the sample of the presence of antibiotic inducing mutations.
                                                                                                                                                                                               17-SEP-1992;

Site_1: ECCR I; Site_2: Xho I; Testes dissected from 1-5
day adult y(*) w(67c1)/Y males raised at 250C. RNA
isolated using Trizol (Life Technologies) and a single
round of Poly(A)+ selection using Oligotex (Olagen). cDNA
library constructed using Stratagene ZAP-cDNA syntesis
kit. Oligo dT-primed, size fractionated -1-6 kb, and
directionally cloned at EccRI and XhoI in Uni-ZAP XR.
Following a single round of amplification pBlueScript SK
phagemids were mass excised. A distribution channel for
clones is being sought, but not currently available.
Requests for clones cannot be honored."

Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. The cDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech University. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Conservative

Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedlings were incubated at 50C for 2 days. Shoots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 600000 pfu were in vivo excised to give pBluescript SK(-) cDNA were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  surface-sterilized, germinated and grown aseptically in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. The cDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech University. Normalization proparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           മ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30 and 45 DAP (Fenton). Total RNA was prepared from each pool, equal quantities of all six RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi)in the TJ Close lab at the University of California, Riverside. Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or

Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. The cDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of the mass excision.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech University. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          07-DEC-1995

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polynucleotide sequences AAHS1947 - AAHS2092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one and comparing it to a number of sequences along with at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying nucleotide or polypeptide sequence for use as drug target involves providing algorithm that analyzes a functional relationship between nucleotide or polypeptide sequences, and comparing the

                                                                                                                                                          The present sequence is that of the Mycobacterium tuberculosis crops (rifampin resistance) gene (bp2161-2640). Amplification and cycle sequencing primers (see AAA49823-62) are used for the detection and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 165/rrs (streptomycin), embB (ethambutch), pncA (pyrazinamide), yyrA (streptomycin), embB (ethambutch), pncA (pyrazinamide), yyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences. AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the
    corresponding to each drug resistance detection probe, a contrast group probe corresponding to each drug resistance detection probe, and a marker for detecting a hybridisation of the oligonucleotide chip and a specimen. The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium generics identification.
                                                                                                                                                                                                                               The invention relates to a diagnostic kit for mycobacterial species identification and drug resistance detection comprising an oligonucleotide chip including a species identification probe, a mycobacterial drug-resistance detection probe, a contrast group promycobacterial drug-resistance detection probe, a contrast group pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               06-DEC-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mycobacterium bovis

                       PCR amplification was used to obtain rpoB genes from rifampi resistant Mycobacterium leprae strains. A comparison with the resistant Mycobacterium leprae strains. A comparison with the requence of the rpoB gene from sensitive strains (AAQ51532) mutations in the region encoding amino acids 400-450. The corregion was isolated from M.tuberculosis (AAQ61457). A commor mutation seen in resistant strains occurs at codon 425 where

The identification probe is comprised of species-specific DNA sequences of mycobacterial rops gene and the detection probe is comprised of one or more modified codons of mycobacterial rops gene. The method involves amplifying rops gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the

English

mycobacterial drug-resistance detection probe, a contrast group probe corresponding to each drug resistance detection probe, and a marker for detecting a hybridisation of the oligonucleotide chip and a specimen contentification probe is comprised of species-specific DNA sequences of

identification and drug resistance detection comprising oligonucleotide chip including a species identification

The invention relates to a diagnostic kit

for mycobacterial

species

probe, an

The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569

                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RpoB gene; mycobacteria; phylogenetic tree construction;
